Project - COVID-19 friendly restaurant info page

User Stories

As people living during the time of COVID-19, we want to design and implement a web application that features COVID-19 friendly information for restaurants and pickup/delivery services for those restaurants.

As users, the application allows them to:
- Sign up and login to use any of the application's services
- Create a new restaurant with name, image, location, hours of operation, pickup status, delivery status, category and foreign link to delivery app(maybe) and a short description
- Create a new delivery service with name, image, short description, link to their website/app
- Rate other users' created restaurants with number rating (1-5), rating title and review
- Rate other users' created delivery services with number rating (1-5), rating title and review
- Edit or Delete their own created restaurants
- Edit or Delete their own created delivery services
- Edit or Delete their own created menu items

As a restaurant, each restaurant:
- is automatically loaded as a thumbnail on a results page
- once selected, a new view/page displays the restaurant information including its name, its image, its location, its hours of operation, its pickup status, its delivery status, its category, user ratings as well as an overall rating and a link to the menu are displayed
- once the menu is selected, a new view/page displays the menu items in a list, including image (if available), short description (if available) and price; the data is fetched from a 3rd party API
- after the initial display, restaurants can be filtered by category, rating, and whether they allow delivery or pickup

As a delivery service, each delivery service:

- is displayed on a delivery services page
- once selected, a new view/page displays the delivery service information, including its name, its short description, its link to website/app and its ratings as well as an overall rating
